Sworn

Say it.
Sworn checks if it's true.

A voice agent that checks what your team says about security against what your systems actually show.

Arjav Mehta and Karthik Kandaswamy, LoxeAI. Bolna Symphony Buildathon.

Sworn checks what your team says against what your systems show, all year.

Always on.

Sworn starts the conversation. It calls the owner of a control at quarter end, or the moment a system changes.

Continuous.

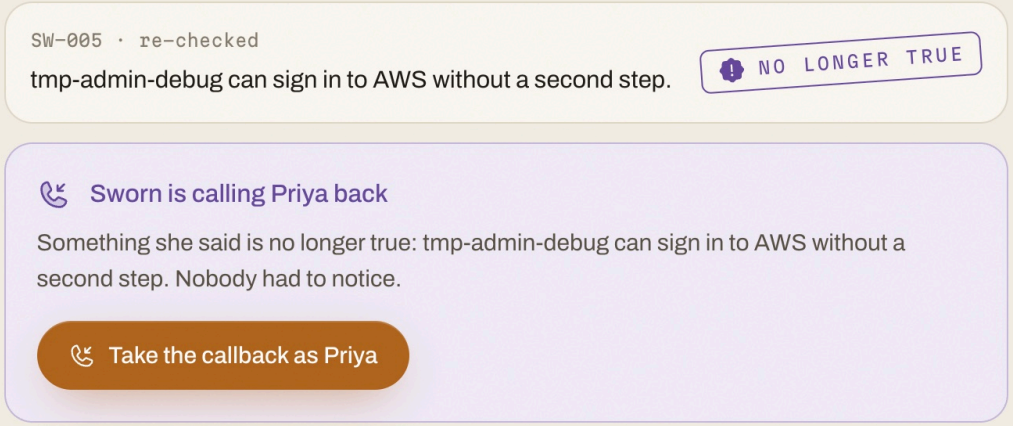

Claims are re-checked whenever Okta, AWS or GitHub change. If something someone said stops being true, Sworn calls them back.

Verifiable.

Every answer points to the system record behind it and carries a signature anyone can check. With no record, Sworn says so.

Then it keeps watching.

An audit is a snapshot. Sworn re-checks every claim whenever the systems change, and calls the person who said it if it stops being true.

Auditors find the mistake six weeks after someone says it.

Today	
Day 1	"MFA is on for everyone."
Week 6	The auditor samples the IAM report.
Week 7	An exception goes into the SOC 2 report.
Week 9	The enterprise deal waits on the fix.

With Sworn on the call	
0:14	"MFA is on for everyone."
0:15	"The IAM report disagrees."
Same day	Fixed and re-checked before any audit.

88%

of SOC 2 exams in one audit firm's 2026 data needed extra rounds of evidence requests.

71%

of those exams ended with at least one exception.

50%

of enterprise software buyers name security review as their biggest delay after choosing a vendor.

Lazarus Alliance 2026 SOC 2 benchmark (75 exams, audit-firm data). G2 2026 Buyer Behavior Report (n=1,038).

Email can't tell you whether the answer is true.

	Email or a form	Sworn
Getting an answer	It waits in an inbox until someone gets to it.	Sworn calls at quarter end. The call takes about 90 seconds.
Checking it	You get whatever was typed.	Checked against Okta, AWS, Linear and GitHub during the call.
When it's wrong	Someone notices weeks later and starts another thread.	Sworn says so on the spot: "The IAM report disagrees."
Follow-ups	One round trip per question.	It asks the auditor's follow-up while the engineer is still on the line.
For the auditor	A reply that someone has to rewrite.	A signed claim, already written in each framework's terms.
Next quarter	Start from scratch.	Already watching. It calls back when something changes.

Why voice: auditors already gather evidence by interviewing people, and engineers explain far more out loud than they write down. The same ledger also answers in text, and to other agents over MCP.

Buyers demand proof now, and voice agents are finally good enough to collect it.

AI companies are selling to enterprises. Those deals open with a security review.

The frameworks keep stacking up. SOC 2, ISO 27001 and 42001, the EU AI Act, India's DPDP Act and FedRAMP 20x ask the same questions in different words.

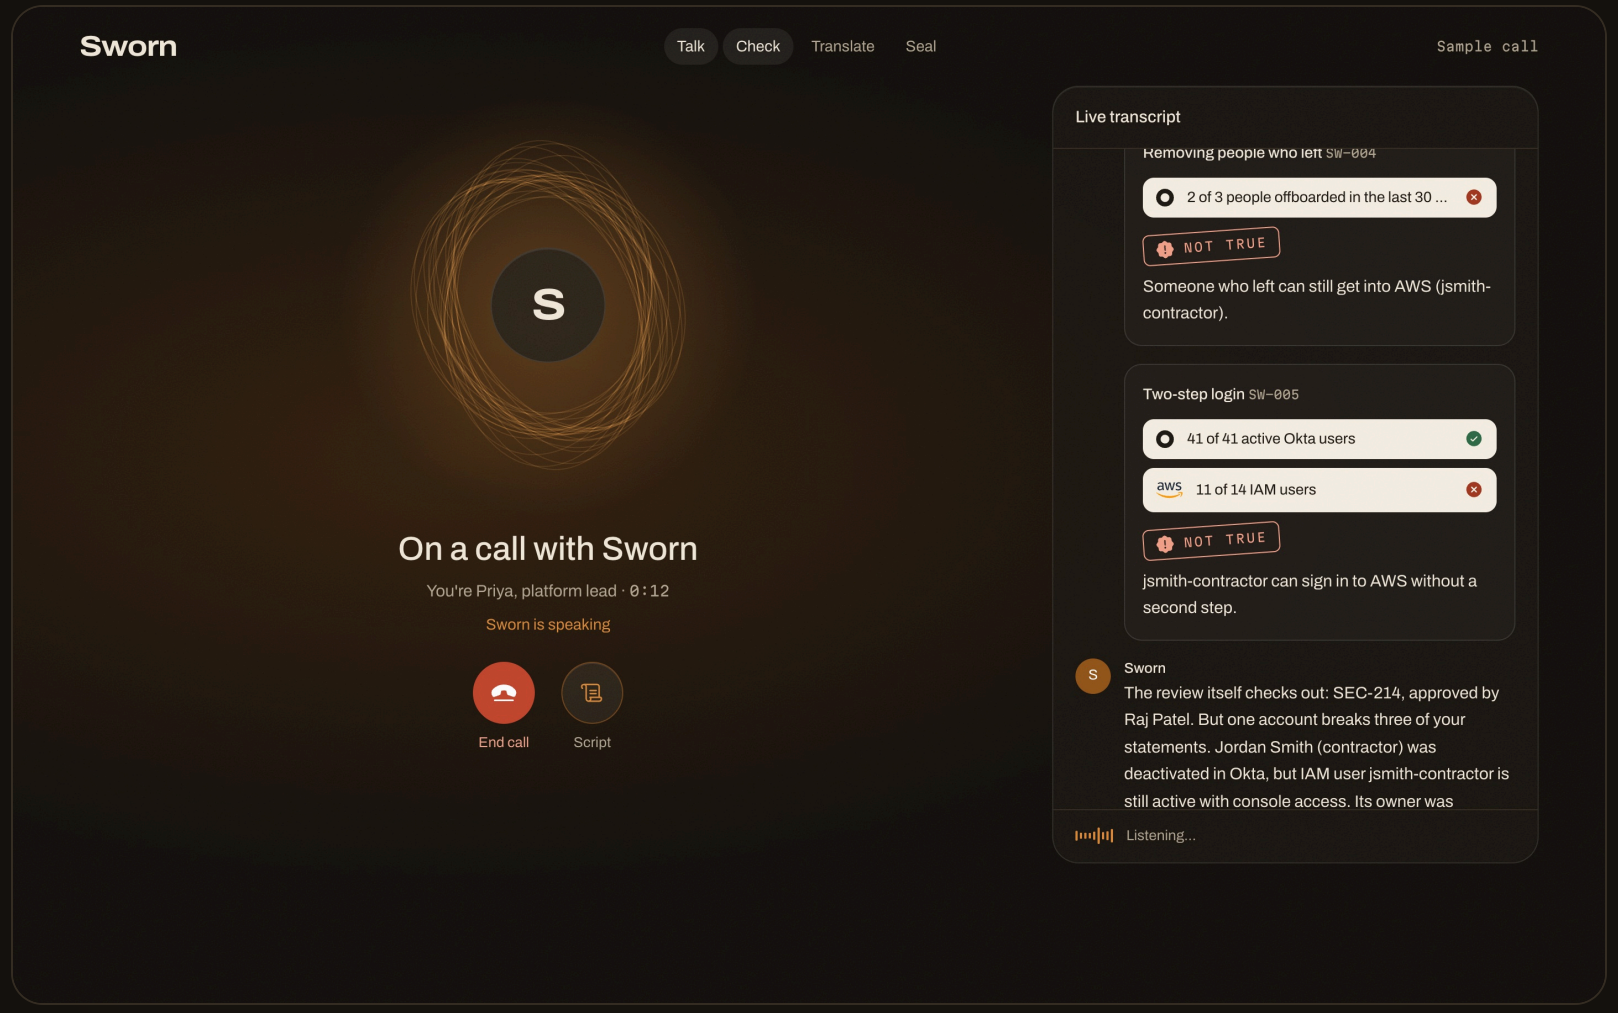

Auditors stopped taking vendor text on faith. After the 2026 allegations that an AI compliance startup fabricated evidence, they want records they can check.

200,000+

calls a day already run on Bolna, in more than ten languages.

TechCrunch, Jan 2026. Delve allegations, Mar 2026 (the company denies them).

Sworn checks each claim while the engineer is still talking.

How one spoken sentence becomes a signed record.

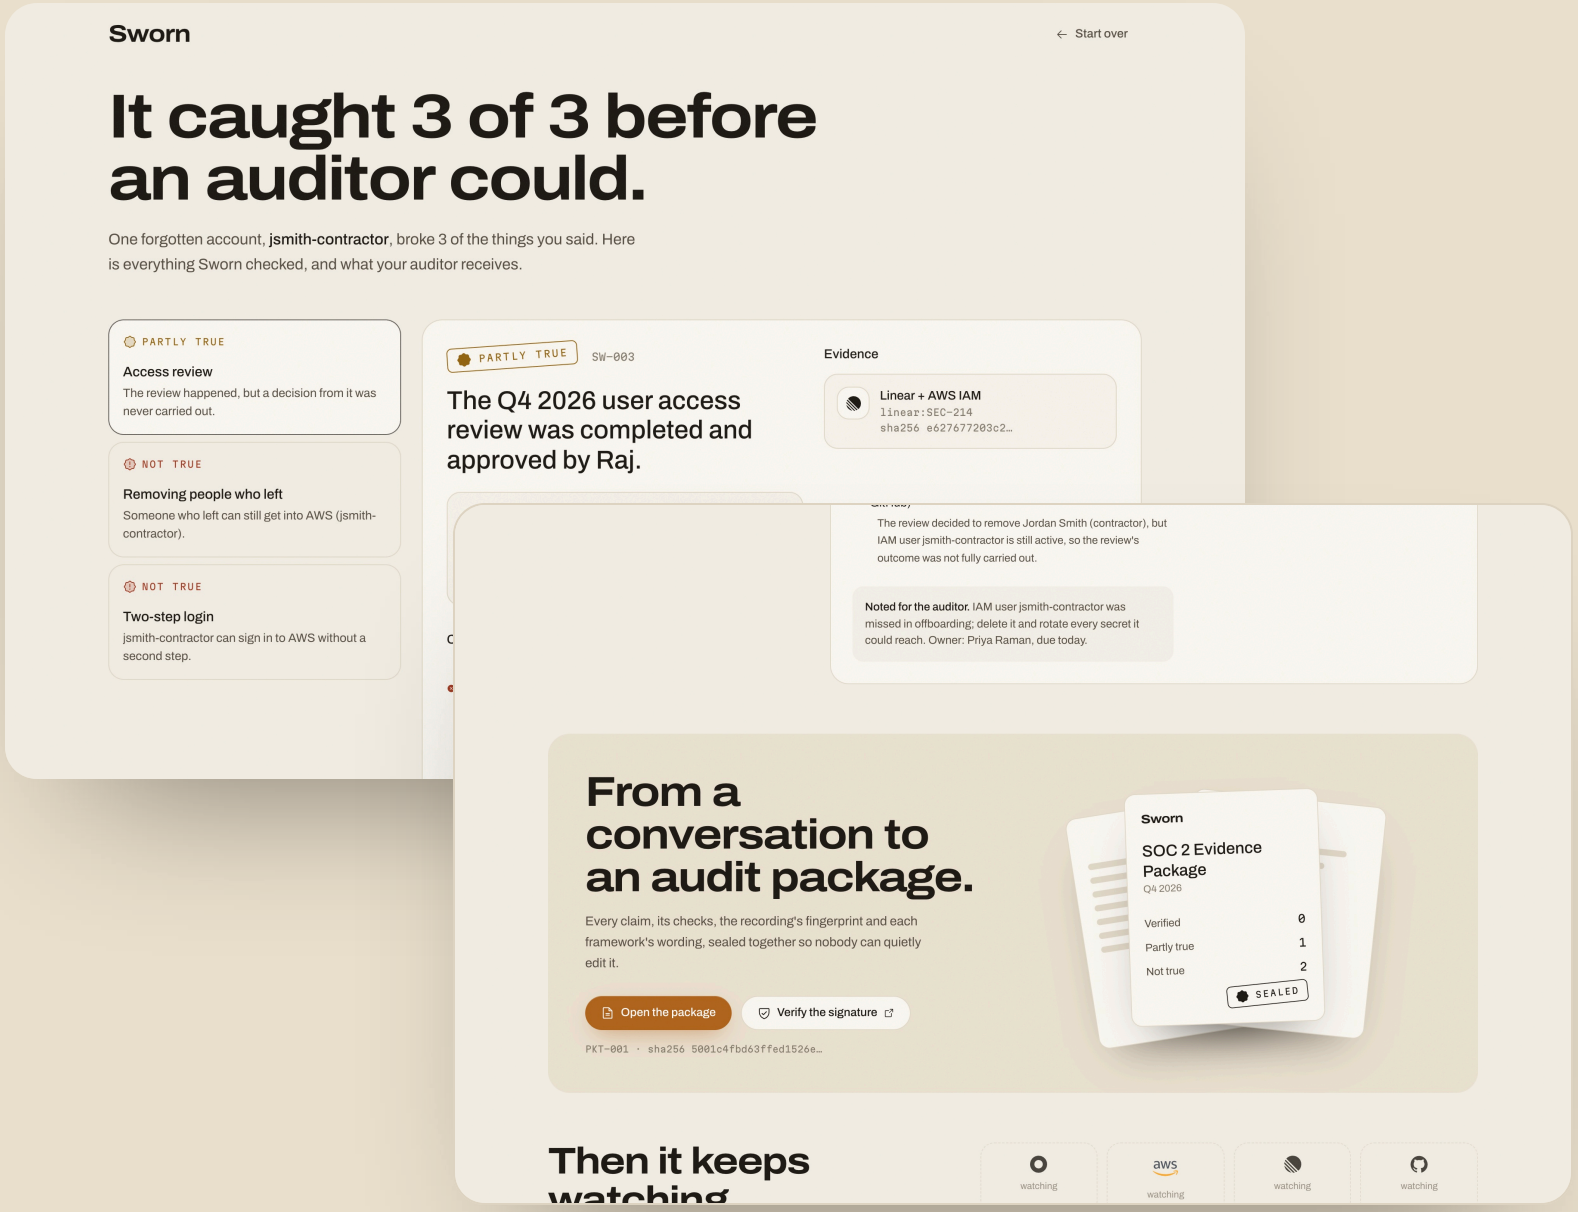

Heard	"MFA's on for everyone."
Typed	`mfa.enforced, scope everyone, okta + aws`
Checked Okta	41 of 41 active people use MFA.
Checked AWS IAM	11 of 14 users pass. **jsmith-contractor** left last week and has no MFA.
Pushed back	"Ah. The IAM report and you have a small disagreement."
Translated	SOC 2 CC6.1, ISO A.8.5, NIST IA-2(1), PCI 8.4.2 and HIPAA 164.312(d).
Sealed	Signed with Ed25519 when the call ends. Change one word and verification fails.

Figures from the demo company, Quillfeather, which is fictional. The checks run on its sample systems.

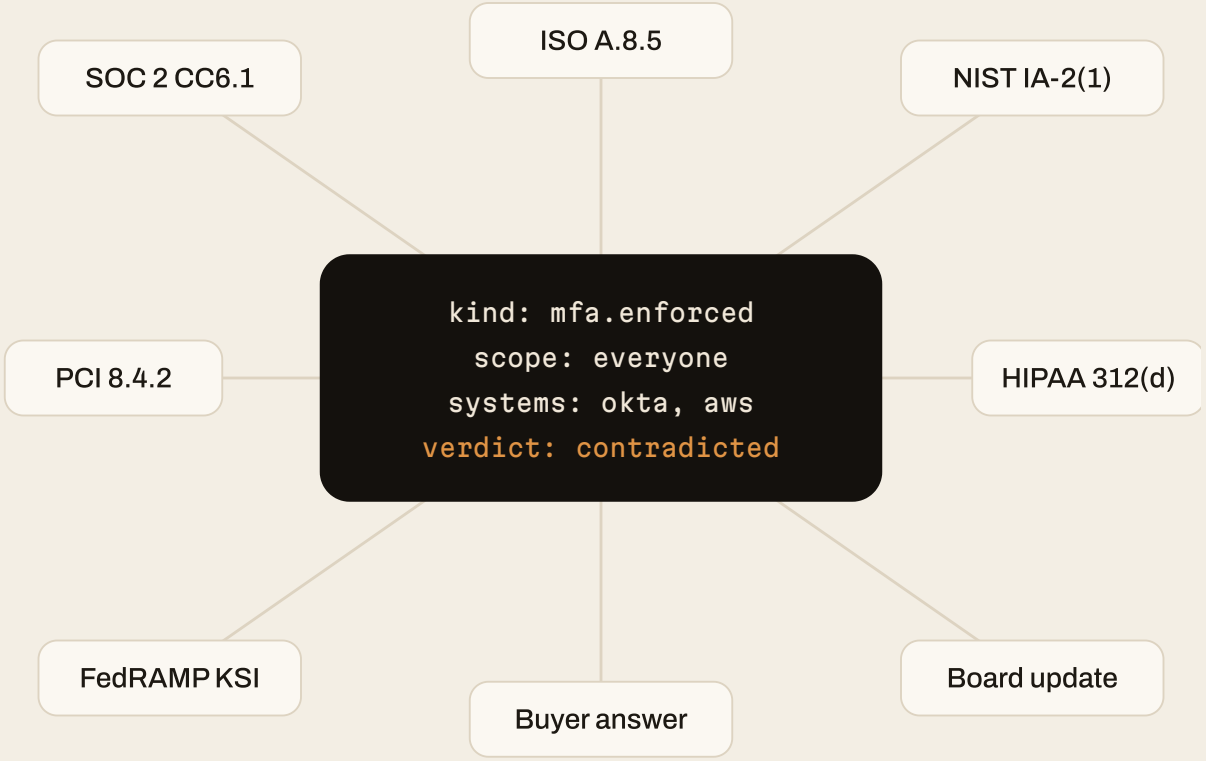

Every call ends in a signed audit package.

It holds each claim, the checks behind it, the owner's response and the wording for every framework.

The signature proves nobody edited the record. The checks are what make it true.

Each sentence becomes a typed claim that the systems can test.

The model listens. The systems decide.

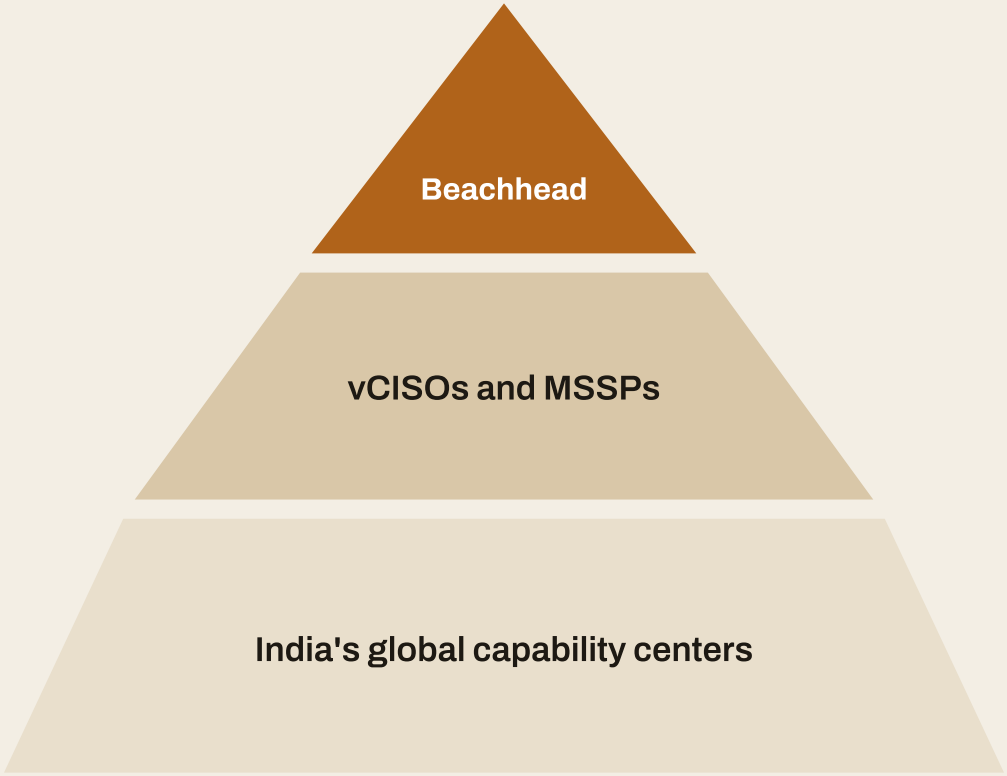

The language model only turns speech into a typed claim. Deterministic checks against real records decide whether it holds.

Templates write the answers.

Every audience's version is generated from checked facts, so no version can claim more than the systems showed. Adding a framework means adding a template.

PCAOB AS 1105 and AICPA AT-C 205 treat inquiry alone as insufficient evidence. Sworn pairs every answer with an inspection of system records.

We start with startups heading into their first SOC 2 Type II.

AI and SaaS startups, 20 to 500 people.
They need SOC 2 Type II to close enterprise deals, and their engineers are the ones answering the auditor.

vCISOs and MSSPs.
They run compliance for dozens of clients and can't sit in on every walkthrough. LoxeAI already sells to them.

India's 2,117 global capability centers.
2.36 million people doing compliance work for US and EU parents, often in Hindi or Hinglish, which Bolna already supports.

GCC figures: Nasscom-Zinnov India GCC Landscape 2026.

The market Sworn enters is growing 23 to 31% a year.

Compliance automation and security questionnaires

$1.0B to $4.3B

2025 to 2031. This is where Sworn sells first.

GRC software overall

$6.5B to $21B

2025, depending on how analysts define it.

Voice AI agents

$2.5B to $35B

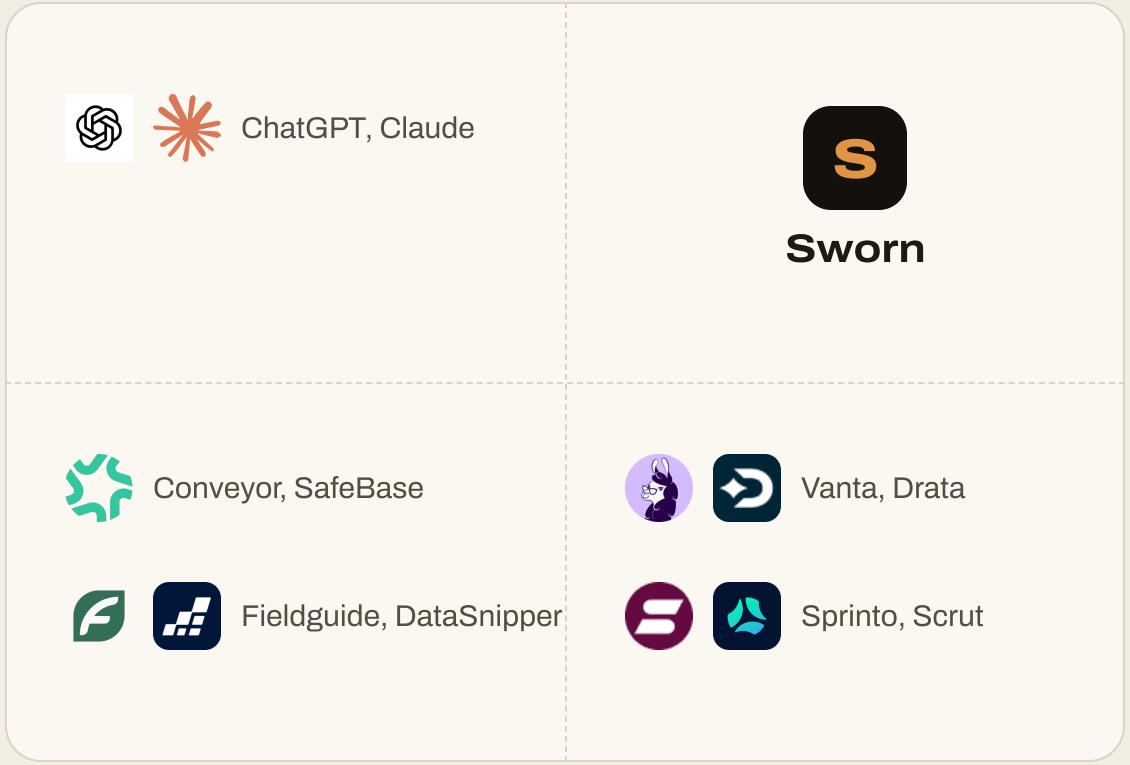

2025 to 2033, growing 39% a year.

$360M+

Bottom-up: more than 30,000 companies already pay for a compliance platform (Vanta 16,000+, Drata 8,500+, Sprinto 3,000+, Scrut 2,500+). At an assumed $12k a year each, that is the starting market.

Mordor Intelligence (continuous compliance automation, questionnaire automation, GRC). Verdantix (GRC). Grand View Research (voice AI agents). Customer counts are vendor-reported. The $12k price is our assumption.

No compliance tool checks what people say.

Compliance platforms pull data from systems, but they reach people through forms and dashboards.

Trust centers answer buyers from documents. Some now do it over MCP, but none of them checks the claims.

Chatbots can rephrase an engineer's words but can't check them.

None of the 25+ GRC, trust and audit vendors we reviewed offers voice.

LoxeAI competitive review, Oct 2026 (vendor sites and press). SafeBase is now part of Drata.

Every call makes the ledger harder to copy.

Each interview adds checked claims and the follow-up questions auditors actually ask. Each system change re-tests them. A competitor starting today starts with an empty ledger.

The evidence engine already exists.
LoxeAI connects to AWS, Okta, Google, GitHub, HR systems and device management, with checks an auditor can re-run.

Audit firms have reviewed it.
LoxeAI is validated by 10+ audit firms, including Prescient Security and Linford & Co.

Anyone can verify a record.
Packets are signed with a published key, and buyers' procurement agents can query the ledger over MCP.

It speaks the engineer's language.
Built on Bolna, so calls can run in Hindi or Hinglish for teams in India.

The team building LoxeAI.

Arjav Mehta

Co-founder and CEO

Northeastern University, class of 2029. BS in Finance and Data Science.

TypeScript, AWS, business development, customer discovery and financial modeling.

Karthik Kandaswamy

Co-founder and CTO

Rensselaer Polytechnic Institute, class of 2029. Dual major in CSCE and ESCE.

Python, C, C++, Java, AWS and Azure.

Advised by the CISOs of **PayNearMe** and **MoneyGram**, and by the **IDEA Venture Accelerator** at Northeastern.

Talk to Sworn.

sworn.loxeai-evt.workers.dev

Next we connect Sworn to LoxeAI's production integrations, add owner sign-off through SSO, launch Hindi and Hinglish calls, and pilot an opt-in incident scribe that tracks regulatory deadlines.
